

Product Specification Sheet

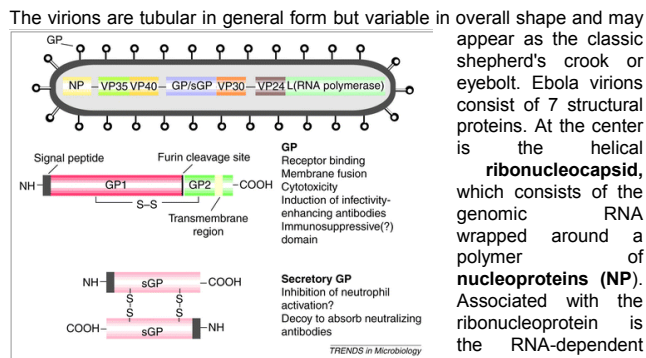

**Zaire Ebola virus glycoprotein Antibodies using DNA expression Vector**

□ Cat # EVGP15-A

Rabbit Anti-Zaire Ebola virus glycoprotein (GP, 1-676aa/DNA vaccine) IgG, purified

SIZE: 100 ul

**Ebola virus (EBOV, formerly Zaire ebolavirus)** causes severe disease in humans and in nonhuman primates in the form of viral hemorrhagic fever.. Zaire ebolavirus is a virological taxon included in the genus Ebolavirus, family Filoviridae, order Mononegavirales. The species has a single virus member, Ebola virus (EBOV). **Ebolavirus species Zaire (ZEBOV)** causes highly lethal hemorrhagic fever, resulting in the death of **90%** of patients within days. Most information on immune responses to ZEBOV comes from in vitro studies and animal models. Ebola Zaire attacks every organ and tissue in the human body except skeletal muscle and bone. Ebola is classified as a **Level 4** pathogen (higher than AIDS) with a 2 to 21 day (7 to 14 days average) incubation period. There are currently five known strains of Ebola: Bundibugyo, Zaire, Sudan, Reston and Tai. All cause illness in sub-human primates. Only Ebola Reston does not cause illness in humans. The mortality rate of Ebola victims is between 60% and 90%; with Ebola Sudan at 60% and Ebola Zaire at 90%.

The virions are tubular in general form but variable in overall shape and may appear as the classic shepherd's crook or eyebolt. Ebola virions consist of 7 structural proteins. At the center is the helical **ribonucleocapsid**, which consists of the genomic RNA wrapped around a polymer of **nucleoproteins (NP)**. Associated with the ribonucleoprotein is the RNA-dependent **RNA polymerase (L)** with the **polymerase cofactor (VP35)** and a **transcription activator (VP30)**. The ribonucleoprotein is embedded in a matrix, formed by the major (VP40) and minor (VP24) matrix proteins. They are surrounded by a **lipid membrane** derived from the host cell membrane. The membrane anchors a glycoprotein (GP1,2) that projects 7 to 10 nm spikes away from its surface. While nearly identical to **Marburg virions** in structure, ebola virions are antigenically distinct. The most common diagnostic methods are RT-PCR in conjunction with antigen-capture ELISA which can be performed in field or mobile hospitals and laboratories. There are currently no FDA-approved vaccines for the prevention of EVD. The most promising ones are DNA vaccines or are based on adenoviruses, vesicular **stomatitis Indiana virus (VSIV)** or **filovirus-like particles (VLPs)** as all of these candidates could protect nonhuman primates from Ebola virus-induced disease. DNA vaccines, adenovirus-based vaccines, and VSIV-based vaccines have entered clinical trials.

**Source of Antigen and Antibodies**

<b>Antigen</b>	DNA vaccine expressing Ectodomain region of Ebola/Zaire glycoprotein (GP) 1-676 aa, protein accession #U23187)
<b>Ab Host/type</b>	Rabbit, Polyclonal IgG Aff. pure (Cat# <b>EVGP15-A</b> ) supplied 0.05% gelatin and 0.05% sodium azide as preservative.
<b>2-Ab</b>	Goat Anti-rabbit IgG-HRP cat # 20320 (AP, biotin, FITC conjugates)
<b>-ve control IgG</b>	#20009-1, Rabbit (non-immune) IgG, purified, suitable for ELISA, Western, IHC as -ve control

**Form & Storage of Antibodies/Peptide Control**

**Antiserum:** 100 ul □ solution □ lyophilized powder  
**Buffer:** PBS/gelatin/0.05% azide  
**Reconstitute powder** 100 ul of water.

**Storage**

**Short-term:** unopened, undiluted vials for less than a week at 40C.

**Long-term:** at 4°C.DD NOT FREEZE.

**Stability:** 6-12 months at -20oC or below.

**Shipping:** 4oC for solutions and room temp for powder.

**Recommended Usage**

**Western Blotting:** **Not recommended for Western blot.** Use #EVGP11-A or #EVGP18-M

**ELISA:** 1:500-1:5000; using 50-100 ng antigen/well. This antibody will serve as a positive control for DNA-expression vaccines targeting the EBOV GP.

**Histochemistry & Immunofluorescence:** not tested.

**Specificity & Cross-reactivity:**

This antibody reacts to the ectodomain region of Zaire ebola virus glycoprotein. Cross-reactivity with other subtypes has not been established. Zaire ebola GP protein is significant conserved in various ebola serotypes: Bundibugyo (65%), Tai Forest D'Ivoire (64%), Sudan (54%), Reston (57%). Antibodies and recombinant GP proteins from various Ebola and Marburg viruses are available for control studies.
