Product description

Williams et al., (1971)¹ introduced a new method based on sequential plating technique to more efficiently isolate and culture new born epithelial liver cells. They used a modified version of MEM medium called Williams' Medium D which was enriched in amino acids and double glucose content. Williams and Gunn (1974)² conducted further studies led to release of Williams' Medium E to be used for the effective long-term culture of adult liver cells. During last decades Williams' Medium E has been widely used for the culture of liver epithelial cells, as well as primary hepatocytes from different species (e.g., human HepaRG cells).

William's Medium E contains unique ingredients such as zinc, iron, manganese, non-essential amino acids, the reducing agent glutathione and the lipid methyl linoleate. William's E Medium can be supplemented, usually with 5-10% fetal bovine serum may be required. William's E Medium uses a sodium bicarbonate (2.2 g/l) buffer system and therefore requires a 5-10% CO₂ environment to maintain physiological pH.
