

Product Specification Sheet

Porcine Circovirus 2 replicase protein (PCV2-rep/ORF1) Rep antibody Positive and negative Controls

– Cat # PCV2R11-PC	Porcine Circovirus 2 replicase protein (PCV2-rep/ORF1) antibody positive control serum	Size 2ml
– Cat # PCV2R11-NC	Porcine Circovirus 2 replicase protein (PCV2-rep/ORF1) antibody negative control serum	Size 2ml

The viral genus **Circovirus** is a part of the family of Circoviridae and contains viral species with non-enveloped, circular ssDNA genomes. These viruses are the smallest viruses replicating autonomously in nucleus of host cells of vertebrate species, including pigs, dogs, and birds such as pigeons, and ducks. The virions of Circoviruses are surprisingly small, with diameters ranging from 17 up to 22 nm. **Porcine circovirus (PCV)** is a small, non-enveloped virus (17 nm in diameter) with a single stranded circular DNA genome. It causes worldwide infection in swine and is highly contagious. Porcine circovirus belong to the genus Circovirus of the Circoviridae family. The virus targets the lymphoid tissue and causes immunosuppression in the host. Pigs affected may experience increased mortality, poor growth, and weight loss, progressing to the level of severe thinning and weakness between 5 to 14 weeks of age. Two species of PCV have been characterized, PCV1 and PCV2. Although PCV1 was initially described as an infectant of porcine kidney cell line (PK15), it shows no pathogenic traits. Recently, PCV2 has been identified as being associated with a new condition in pigs, the post weaning multi-systemic wasting syndrome (PMWS), first described in Western Canada. This syndrome is characterized clinically by progressive weight loss, dyspnea, and jaundice and pathologically by lymphadenopathy, interstitial pneumonia, hepatitis, and nephritis. Similar syndromes have also been recently reported in the United States, Europe, and Asia. Other diseases, such as porcine dermatitis and nephropathy syndrome (PDNS), proliferative and necrotizing pneumonia (PNP), perina-talmiocarditis and reproductive failures are also associated with PCV2. PMWS is commonly diagnosed on the continents of North America, Europe and Asia.

The PCV genome (~1.76 kb) has three main **open reading frames (ORFs)** that encode well characterized proteins: ORF1 encodes the viral **replicase**

proteins (REP and REP') that are essential for rolling circle replication. The replicases differ in that Rep is the full ORF1 transcript of 312-aa, whereas Rep' is a truncated form of ORF1 as a result of splicing and is only 168-aa in length. The two replicase enzymes that are created from ORF1, Rep and Rep', are conserved between the two types of PCV, and are part of the early phase of the virus.

ORF2 encodes the viral capsid protein (Cap) involved in host immune response. ORF2 differ slightly between PCV-1 and PCV-2. Antibodies to ORF2 are found in experimental PCV2 infection. ORF3 encodes an apoptotic protein, which is essential for the development of the viral pathogenesis. The non-pathogenic PCV1 and the pathogenic PCV2 share ~68-76% protein identity (~90% DNA). PCV2 are divided into five genotypes (PCV2a, PCV2b, PCV2c, PCV2d, and PCV2e) that are ~95% conserved. PCV2a was long the predominant strain in the global pig population and is also the basis of all major commercially available PCV2 vaccines. Currently, PCV2b is the most commonly identified strain in pigs. Diagnosis of PCV is confirmed by finding the typical histological lesions and demonstration of viral antigen or DNA within the lesions by immunohistochemical (IHC) or in situ hybridization methods (ISH) or by ELISA.

Source and Forms of Controls

Porcine protein antibody controls were prepared from animal's sera that were infected with the PCV2 virus or had antibodies due to natural infection. The controls are tested in ELISA using purified protein coated plates.

PCV2R11-NC; **antibody –ve control**

Porcine serum in a stabilizing buffer supplied as liquid (2 ml) or in lyophilized form. Reconstitute powder with 2 ml distilled water. When tested undiluted the –ve control yielded PCV2 ORF1 antibody **ELISA # AE-200250-1**, A450=<0.400. For testing in

other ELISAs or applications, users must determine the sample dilutions

PCV2R11-PC; **antibody +ve control**

Porcine serum in a stabilizing buffer supplied as liquid (2 ml) or in lyophilized form. Reconstitute powder with 2 ml distilled water. When tested undiluted the +v control yielded PCV2 ORF1 antibody **ELISA # AE-200250-1**, A450=>1.500. For testing in other ELISAs or applications, users must determine the sample dilutions.

Storage:

–ve or +ve controls at 4°C for 1-3 months or store frozen at -20°C in suitable size aliquots.

Stability: 6-12 months at –20°C or below.

Shipping: 4°C for solutions and room temp for powder.

Specificity & Cross-reactivity

PCV2 Rep protein sequence are about 68-76% conserved in various isolates. Antibodies and recombinant proteins to PCV2 Rep protein is available for control studies.
