

Product Data Sheet

Cat# SP-52293-1

Description: Pancreatic Polypeptide, Human [H-Ala-Pro-Leu-Glu-Pro-Val-Tyr-Pro-Gly-Asp-Asn-Ala-Thr-Pro-Glu-GLn-Met-Ala-Gln-Tyr-Ala-Ala-Asp-Leu-Arg-Arg-Tyr-Ile-Asn-Met-Leu-Thr-Arg-Pro-Arg-Tyr-NH₂;MW: 4181.8]

Size: 0.5 mg

Purity: >95%

Store: Desiccated at -20oC.

Pancreatic hormone is synthesized in pancreatic islets of Langerhans and acts as a regulator of exocrine pancreatic secretion, biliary tract motility, and food intake. Its secretion in humans is increased after a protein meal, fasting, exercise, and acute [hypoglycemia](#) and is decreased by [somatostatin](#) and intravenous [glucose](#). Plasma PP has been shown to be reduced in conditions associated with increased food intake and elevated in [anorexia nervosa](#). It stimulates the gastric juice secretion, but inhibits the gastric secretion induced by pentagastrine. It is the antagonist of [cholecystokinin](#) and inhibits the pancreatic secretion which was stimulated by cholecystokinin. On fasting, PP seric concentration is 80 pg/ml; after the meal, it rises up from 8 to 10 times more; glucose and fats also induce PP's level increase, but on parenteral introduction of those substances, the level of hormones doesn't change. The administration of [atropine](#), the [vagotomy](#), blocks the PP's after-meal secretion. The excitation of the [vagus nerve](#), the administration of [gastrin](#), [secretin](#) or cholecystokinin induce PP secretion.
