

Product Information Sheet**M5600
Meropenem**

Synonyms: Mesalazine; Mesalamine
CAS: 96036-03-2
Formula: C₁₇H₂₅N₃O₅S
Mol. Weight: 383.46

Properties

Form: Powder
Appearance: White to Light Yellow
Application: Antibiotic
Solubility: Water
Storage Temp: 2-6°C
Typical Working Concentration: Varies by application. Concentration should be determined by end user.
Other Notes: Plant Tissue Culture Tested

Application Notes

A broad spectrum antibiotic that has a high affinity for cell wall-synthesizing enzymes. Meropenem is very effective because it resists inactivation by the majority of microbial LACTB (β-lactamases). It is a beta-lactam and belongs to the subgroup of carbapenem. Meropenem is bactericidal except against *Listeria monocytogenes* where it is bacteriostatic. It inhibits bacterial wall synthesis like other beta-lactam antibiotics. In contrast to other beta-lactams, it is highly resistant to degradation by beta-lactamases or cephalosporinases.

The spectrum of action includes many gram-positive and gram-negative bacteria (including *Pseudomonas*) and anaerobic bacteria.

Konagaya *et al.* note the successful elimination of *Agrobacterium* from *Cryptomeria japonica* (Japanese cedar) cultures using a concentration of 10 mg/L of Meropenem without observing phytotoxic effects.
